

Farm tractors are often considered a farmer's best friend, but in some cases, they can turn out to be a farmer's worst enemy. Tractors are one of the most dangerous pieces of machinery ever created. They are the major cause of occupational fatalities in agricultural regions. On average, one person dies every 3 days caused by tractor rollovers. As the deaths due to tractor rollovers increase the need for protection increase as well. Tractor accidents are preventable and the

injuries and deaths due to tractor rollovers can be greatly reduced if proper protection were used.

Tractor rollovers happen when the center of gravity moves past a baseline of stability, either to the side or the rear of the tractor. The center of gravity must be kept within the baseline of stability to keep the tractor right side up. When gravity is no longer able to play its role, the tractor is then on its own, usually resulting in a roll over and causing serious injury or even death.

Tractor rollover related deaths have been a concern for decades. Here at Veradyn we pride ourselves to the fact that we have the possibilities to help save lives, and can do it without killing your pocketbook. This product was developed for the Colorado

Department of Transportation. This tractor rollover alarm will alert the driver if the terrain is unsafe, unsafe driving practices, or the combination of terrain and unsafe driving practices. C-DOT uses this product in their mowing tractors. One of the great things about this device is that they can be used on every type of tractor. This device is needed in every operating tractor for the simple fact that any possible bad situation can be prevented with the correct tactical action.
